FAT TRANSFER PROCEDURES

This is an informed consent document that has been prepared to help inform you concerning fat transfer (fat grafts or fat injection procedures), its risks, and alternative treatments.

SURGERY ACKNOWLEGMENT

A person's own fat may be used to improve the appearance of the body by moving it from an area where it is less needed (usually the thighs or abdomen) to an area that has lost tissue volume due to aging, trauma, surgery, birth defects, or other causes. Typically, the transferred fat results in an increase in volume of the body site being treated. Before the procedure, the areas from where the fat is being removed may be injected with a fluid to minimized bruising and discomfort. The fat may be removed from the body by a narrow surgical instrument (cannula) through a small incision or may be excised (cut out) directly through a larger incision. In some cases the fat may be prepared in a specific way before being replaced back in the body. This preparation may include washing, filtering, and centrifugation (spinning) of the fat. The fat is then placed into the desired area using either a smaller cannula or needle, or it may be placed directly through an incision. Since some of the fat that is transferred does not maintain its volume over time, your surgeon may inject more than is needed at the time to achieve the desired end result. Over a few weeks, the amount of transferred fat will decrease. At times, more fat may need to be transferred to maintain the desired results. Fat transfer procedures may be done using a local anesthetic, sedation, or general anesthesia depending on the extent of the procedure.

ALTERNATIVE TREATMENTS

Alternative forms of nonsurgical and surgical management consist of injections of man-made substances to improve tissue volume (such as hyaluronic acid, polylactic acid, etc.), use of man-made implants, or other surgical procedures that transfer fat from the body (flaps).

Risks and potential complications are associated with alternative forms of treatment.

RISKS OF FAT TRANSFER PROCEDURE

Every procedure involves a certain amount of risk, and it is important that you understand the risks involved. An individual's choice to undergo a procedure is based on the comparison of the risk to its potential benefit. Although the majority of patients do not experience these complications, you should discuss each of them with your surgeon to make sure you understand the risks, potential complications, and consequences of the procedure.

BLEEDING

It is possible, though unusual, to experience a bleeding episode during or after this procedure. Should bleeding occur, it may require emergency treatment to drain accumulated blood (hematoma). Do not take any blood thinning medications, aspirin, or nonsteroidal anti-inflammatory medications (acetaminophen is acceptable) for ten days before the procedure, as these may contribute to a greater risk of bleeding or significant bruising. Tell your surgeon if you are on any of these medications before stopping them.

SEROMA

Although unlikely, a collection of fluid may appear at the site where the fat was removed. This is usually treated by draining the fluid with a needle.

INFECTION

Infection is unusual after this procedure. Should an infection occur, additional treatment including antibiotics or surgery may be necessary.

SCARRING

All invasive procedures leave scars, some more visible than others. Although good wound healing after a procedure is expected, abnormal scars may occur both within the skin and in the deeper tissues. Scars may be unattractive and of different color than the surrounding skin. There is the possibility of visible marks from sutures used to close the wound. Scars may also limit motion and function. Additional treatments including surgery may be needed to treat scarring.

• CHANGE IN APPEARANCE

Typically, the transferred fat loses some of its volume over time and then becomes stable. It is possible that more

treatments may be needed to maintain the desired volume of the transferred fat and resulting appearance. Less commonly, if you experience significant weight gain, the transferred fat may increase in volume and cause an undesirable appearance. It is important to understand that more than one treatment may be needed and therefore to discuss with your surgeon the costs associated of repeat treatments.

• FIRMNESS AND LUMPINESS

While most transferred fat results in a natural feel, it is possible that some or all of the fat may become firm, hard, or lumpy. If some of the fat does not survive the transfer, it may result in fat necrosis (death of transferred fat tissue), causing firmness and discomfort or pain. Cysts may also form at the site of the transferred fat. Surgery may be required to improve such conditions.

ASYMMETRY

Symmetrical body appearance may not result from a fat transfer procedure. Factors such as skin tone, fatty deposits, bony prominence, and muscle tone may contribute to normal asymmetry in body features.

Subsequent changes in the shape or appearance of the area where the fat was removed or placed may occur as the result of aging, weight loss or gain, or other circumstances not related to the fat transfer procedure.

PAIN

Chronic pain may occur rarely after fat removal or transfer.

TISSUE LOSS

In rare cases, the transferred fat may cause the skin over the treated area to be injured resulting in loss of the skin and surrounding tissue. This may leave scars and disfigurement and require surgery for treatment.

• DAMAGE TO DEEPER STRUCTURES

Deeper structures such as nerves, blood vessels, or muscles may be damaged during the course of this procedure. The potential for this to occur varies according to where on the body the procedure is being performed. Injury to deeper structures may be temporary or permanent.

• UNSATISFACTORY RESULT

There is the possibility of an unsatisfactory result from the procedure, resulting in unacceptable visible deformities, loss of function, wound disruption, skin death, or loss of sensation. You may be disappointed with the results of the procedure.

• ALLERGIC REACTIONS

In rare cases, local allergies to tape, suture material, or topical preparations have been reported. Systemic reactions, which are more serious, may result from drugs used during the procedure or prescription medicines. Allergic reactions may require additional treatment.

ADDITIONAL SURGERY NECESSARY

In some situations, it may not be possible to achieve optimal results with a single procedure. Multiple procedures may be necessary. Should complications occur, surgery or other treatments may be necessary. Even though risks and complications occur infrequently, the risks cited above are the ones that are particularly associated with fat transfer procedures. Other complications and risks can occur but are even more uncommon. The practice of medicine and surgery is not an exact science. Although good results are expected, there cannot be any guarantee or warranty expressed or implied on the results that may be obtained.

CONSENT FOR SURGERY, PROCEDURE OR TREATMENT

- 1. I hereby authorize Dr. Bourget and such assistants as may be selected to perform the following procedure or treatment.
- 2. I recognize that during the course of the operation and medical treatment or anesthesia, unforeseen conditions may necessitate different procedures than those above. I therefore authorize the above surgeon and assistants or designees to perform such other procedures that are in the exercise of my surgeon's professional judgment necessary and desirable. The authority granted under this paragraph shall include all conditions that require treatment and are not known to my surgeon at the time the procedure is begun.
- 3. I consent to the administration of such anesthetics considered necessary or advisable. I understand that all forms of anesthesia involve risk and the possibility of complications, injury, and sometimes death.
- 4. I acknowledge that no guarantee has been given by anyone as to the results that may be obtained.

5. I consent to the photographing of the opbody, for medical, scientific or educational		
6. For purposes of advancing medical educ 7. I consent to the disposal of any tissue, m		
8. It has been explained to me in a way that	at I understand:	
A. The above treatment or procedure to B. There may be alternative procedures C. There are risks to the procedure or tre	or methods of treatment
